

Climate Change Concepts, Science and Impacts - Online blog

I. **Title: Global warming messing with Earth's wobble [Web log post].** The

Associated Press (2016, April 8).

Description: The spin of the earth is a constant in our lives. It's quite literally why night follows day. And while that cycle isn't going away, climate change is messing with the axis upon which our fair planet spins. Ice melting has caused a drift in polar motion, a somewhat esoteric term that tells scientists a lot about past and future climate and is crucial in GPS calculations and satellite communication.
